A numerical set-up for benchmarking and optimization of fluid-structure interaction

Stefan Turek, Mudassar Razzaq and Jaroslav Hron
TU Dortmund, Germany

with support by M.Schäfer, M. Heck, M. Krafczyk, J. Tölke, S. Geller, H.-J. Bungartz, M. Brenk, R. Rannacher, T. Dunne, W. Wall, A. Gerstenberger, E. Rank, A. Düster, S. Kollmannsberger, K.-U. Bletzinger, R. Wüchner, A.Kupzok, T. Gallinger, U. Israel

Open Industrial Day Jyväskylä, Finland

March 16, 2009

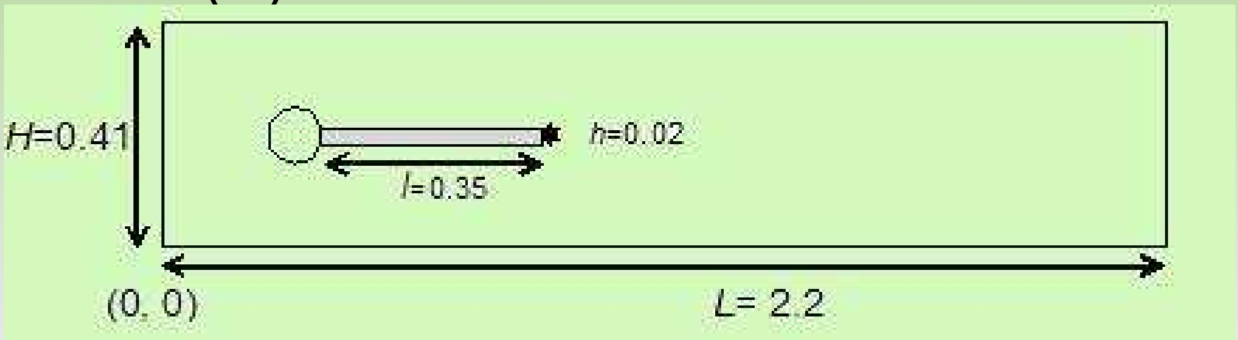
Integrated Multiphysics Simulations & Design optimization

Requirements for numerical FSI benchmarking

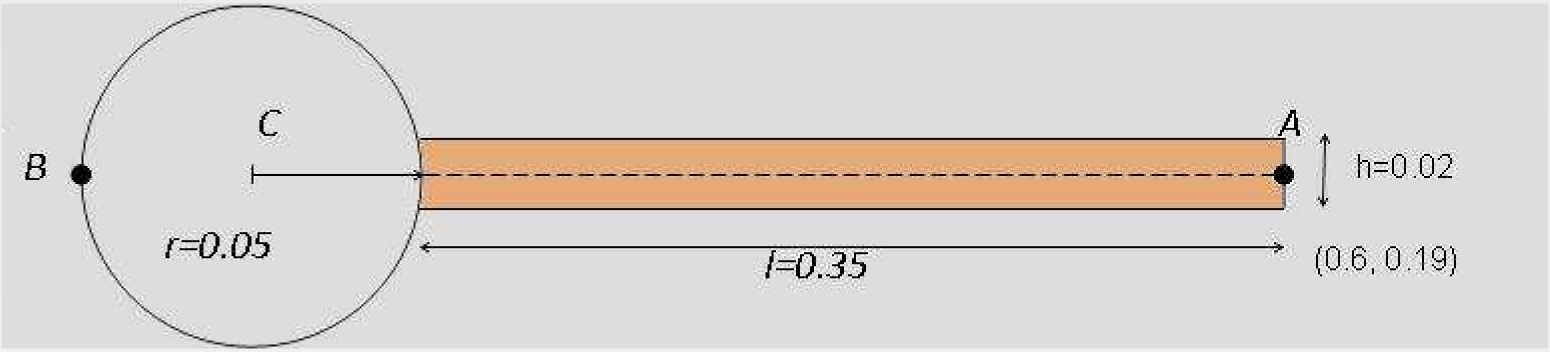
- *Realistic materials*
  - **incompressible Newtonian fluid**, laminar flow regime
  - **elastic solid**, large deformations
- *Comparative evaluation*
  - setup with periodical oscillations
  - non-graphically based quantities
- *Computable configurations*
  - laminar flow
  - reasonable aspect ratios
  - simple geometry (2D)
- Mainly based on validated CFD benchmarks, but also close to experimental set-up

Computational domain

- Domain dimensions (m)

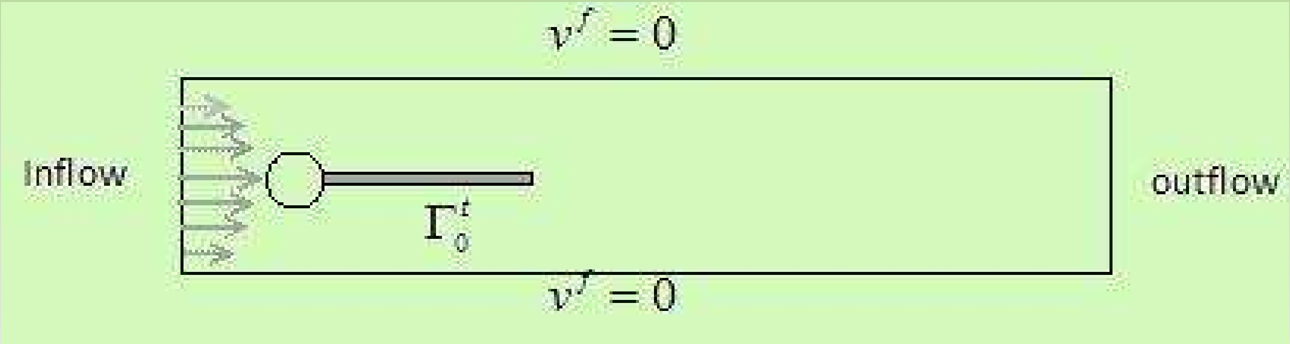


- Detail of the submerged structure



$$A(t=0)=(0.6, 0.2), \quad B=(0.15, 0.2), C=(0.2, 0.2)$$

Boundary and initial conditions



Inflow parabolic velocity profile is prescribed at the left end of the channel

Outflow condition can be chosen by the user, assuming zero reference pressure

Otherwise the *no-slip* condition is prescribed for the fluid on the other boundary parts.

Initial no flow fluid and no deformation + smooth increase of the inflow profile

Fluid and structure properties

- **Incompressible** fluid with density ρ^f

$$\rho^f \frac{\partial \mathrm{v}^f}{\partial t} + \rho^f \left(\nabla \mathrm{v}^f\right)\mathrm{v}^f = \operatorname{div} \sigma^f \qquad \text{in } \Omega_t^f$$

$$\operatorname{div} \mathrm{v}^f = 0$$

$$\sigma^f = -p^f \mathrm{I} + \rho^f \nu^f \left(\nabla \mathrm{v}^f + \nabla \mathrm{v}^{f\,\mathrm{T}}\right)$$

- Elastic material with density, $\rho^s,\ \mathrm{F} = \mathrm{I} + \nabla \mathrm{u}^s,\ J = \det \mathrm{F}$: **St. Venant -- Kirchhoff** material

$$\rho^s \frac{\partial^2 \mathrm{u}^s}{\partial t^2} = \operatorname{div}\left(\sigma^s \mathrm{F}^{-\mathrm{T}}\right) \qquad \text{in } \Omega^s$$

$$\sigma^s = \frac{1}{J}\mathrm{F}\left(\lambda^s (\mathrm{tr}\mathrm{E})\mathrm{I} + 2\mu^s \mathrm{E}\right)\mathrm{F}^{\mathrm{T}}$$

$$\mathrm{E} = \frac{1}{2}\left(\mathrm{F}^{\mathrm{T}}\mathrm{F} - \mathrm{I}\right)$$

Suggested material parameters

solid

ρ^s density

ν^s Poisson ratio

μ^s shear modulus

fluid

ρ^f density

ν^f kinematic viscosity

Parameter	polybutadiene & glycerine	**polypropylene & glycerine**

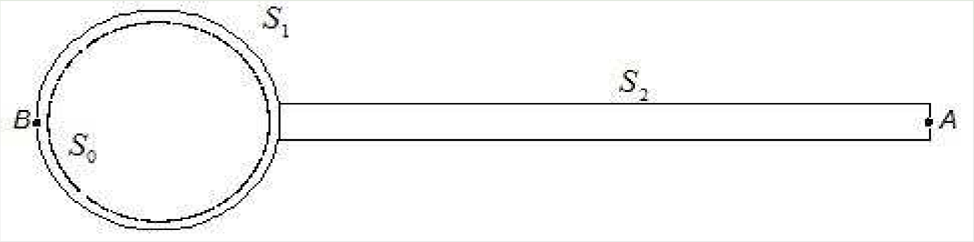
Quantities of interest

- The position $A(t)=(x(t), y(t))$ of the end of the structure
- Pressure difference between the points *A(t)* and *B*

$$\Delta p^{AB}(t) = p^{B}(t) - p^{A(t)}(t)$$

- Forces exerted by the fluid on the *whole body*, i.e. lift and drag forces acting on the cylinder and the structure together



$$(F_D, F_L) = \int_S \sigma\, ndS = \int_{S_1} \sigma^f ndS + \int_{S_2} \sigma^{f|S} ndS = \int_{S_0} \sigma\, ndS$$

- Frequency and maximum amplitude
- Compare results for *one* full period and 3 different levels of spatial discretization *h* and 3 time step sizes Δt

FSI1: steady, small deformations

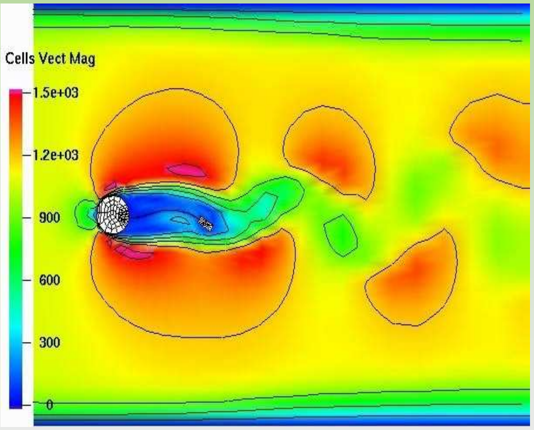
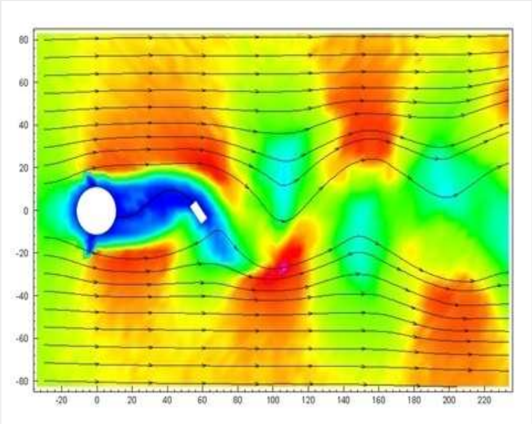
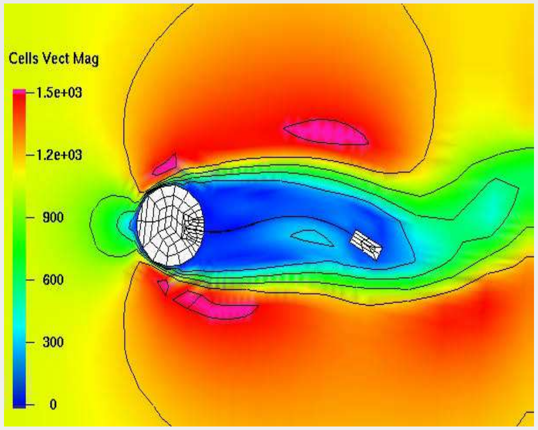
FSI4: New configuration

+ Laminar Flow (glycerine)
+ “2D‘‘ flow and deformation
- Rotational degree of freedom
- Large aspect ratio (thin structure),
- Corners







Flustruc experiment, Erlangen

Computation

FSI Optimization

- Optimization problem
  - Associated design or control variable
- The main design aims could be
  I) Drag/Lift minimization
  II) Minimal pressure loss
  III) Minimal nonstationary oscillations
- To reach these aims, we might allow
  1. Boundary control of inflow section
  2. Change of geometry: elastic channel walls or length/thickness of elastic beam
  3. Optimal control of volume forces
- Optimal control of nonstationary flow might be hard for the starting
- Results for the moment are combination of I)-III) with 1)-3).

FSI Optimization: Example 1

- uncontrolled flow

	ux of A $[\times 10^{-3}$ m]	uy of A $[\times 10^{-3}$ m]	drag	lift
FSI1	0.0227	0.8209	14.295	0.7638

lift $\neq$ 0

- Aim: $\text{minimize}\left(lift^2 + \alpha V^2\right)$

w.r.t V1, V2.

V1 velocity from top

V2 velocity from below

FSI Optimization: Example 1

- TESTS for FSI 1 (Boundary control)

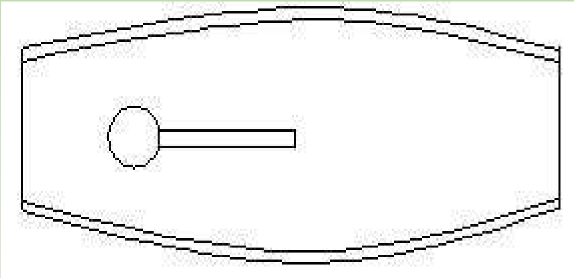
More examples

- further examples might be:



1. $\text{minimize}\left(lift^2 + \alpha V^2\right)$ for deformed case
2. pressure loss minimize: $\text{minimize}\left(p_{in} - p_{out}\right)$

w.r.t elastic deformation of the wall

or

w.r.t geometrical and material properties of beam

Suggestions

0) Validate your FSI Code

1) FSI1 + EX1

send us results → until summer

1) Preliminary tests:

for other examples → discuss via internet, until fall
